

BATHTUB AND SHOWER THRESHOLD

Abstract

A threshold for a bathtub or shower base assembly includes a slope configured
5 to direct water away from an exterior toward an interior of the tub or assembly. The
slope declines as it extends inwardly, thereby preventing water from leaking. The slope
includes an outer portion that is higher than an inner portion, and a surface in between
that faces upwardly and inwardly. The slope is disposed along an axial length of an
outer side of the tub or base assembly. The slope is disposed outwardly of a
10 horizontally flat surface which, in a tub, may be configured for supporting a sliding door.
